**Supplemental Phase II Environmental Site Assessment - DRAFT**  
**Hounsfield Heights – Briar Hill Community**  
**Calgary, Alberta**

**File CG2430.1 E28**

Sears Canada Inc. (Sears) was issued Environmental Protection Order (EPO) No. EPO-2018/01-SSR in March 2018 pertaining to the Hounsfield Heights and North Hill Mall, Calgary, Alberta (Site) historic gasoline plume. As part of this EPO, one of the requirements was obtaining complete delineation of the gasoline plume within the soil and groundwater at the Site. Based on previous investigations completed by Clifton Associates Ltd, delineation was still required in the southwestern portion of the Site.

This report documents the supplemental drilling completed in the southwestern corner of Hounsfield Heights in the road allowance extending 10<sup>th</sup> Avenue NW to the west. A Site and Surrounding Land Use map is provided as Figure 1 in Appendix A. A map of the Site and Surrounding Properties is provided as Figure 2. A Monitoring Well Location Plan is provided as Figure 3 (Appendix A). The purpose of drilling in this area of the Site was to fully delineate the gasoline plume in the soil and groundwater to the southwest, based on a previously identified data gap. Based on this new data, Clifton also updated the existing stratigraphic cross-sections in this area.

## **General Site Description**

The Alberta Township System description of the Site is the northeast corner of Section 20, Township 24, Range 1, West of the 5<sup>th</sup> Meridian (NE ¼ 20-24-1 W5M). The Site occupies approximately 40 hectares (100 acres), and is currently a mixture of operating commercial properties, private residences, and parkland.

The Mall area is the portion of the Site located north of 14<sup>th</sup> Avenue NW, which includes the North Hill Shopping Centre, the former Sears property (now a Kal-Tire Automotive Centre located at 1614 – 14<sup>th</sup> Avenue NW), and a condominium complex. The Hounsfield Heights area is the portion of the Site south of 14<sup>th</sup> Avenue NW, including Lions Park, to 10<sup>th</sup> Avenue NW.

## **Site History**

The location of the Kal-Tire was originally developed as a service station and automotive centre in 1958. The service station was located at the North Hill Shopping Centre on a property owned by Sears, and operated as a Sears Service Centre from 1958 to 1984. From 1984 to 1995, the location was operated under license as a Sunoco Service Station. An addition to the automotive centre building was constructed

in 1982, and a separate gas bar kiosk was added in 1989. The original USTs were replaced in 1984, and in October 1995, fuel storage and dispensing facilities at the gas bar were decommissioned. The former Sears Service Centre continues to operate under license to Kal-Tire.

### Previous Environmental Investigations

Clifton has completed numerous historical environmental site assessments (ESAs) to characterize the petroleum hydrocarbon (PHC) impacts on-Site. A complete overview of the previous findings is available in the Clifton report entitled *2018 Second Quarter Groundwater Monitoring and Sampling Report, Hounsfield Heights – Briar Hill Community, Calgary, Alberta* (09 May 2018).

The Clifton report *2016 Supplemental Drilling Report Hounsfield Heights – Briar Hill Community, Calgary, AB* (05 July 2016) determined that additional drilling was required to vertically and laterally delineate the PHC plume, specifically benzene, at the southern extent of the plume.

### Objective and Scope of Work

The objective of this investigation was to obtain complete delineation of the contaminants of potential concern (CoPC) in the soil and groundwater in the southwestern corner of the Site. A secondary objective was to update the existing stratigraphic cross-sections of the Site. These CoPCs have historically included benzene and 1,2-dichloroethane (1,2-DCA). To meet these objectives, the proposed scope of work included:

- Contacting Alberta One Call and a private utility locator to identify the locations of underground utilities/facilities prior to the drilling program;
- Advance three boreholes to a proposed maximum depth of 9.1 metres below ground surface (m bgs);
- Submit two soil samples from each borehole for laboratory analysis of benzene, toluene, ethylbenzene, and total xylenes (BTEX), PHC fractions F1 to F4, polyaromatic hydrocarbons (PAHs), and volatile organic compounds (VOCs);
- Install up to three nested groundwater monitoring wells at each of the three borehole locations, each completed with a flush-mounted road box;
- Monitor and develop each of the newly-installed monitoring wells;
- Collect one groundwater sample from each of the monitoring wells and submit for laboratory analysis of BTEX, PHC fractions F1 and F2, PAHs, and VOCs;
- Survey the horizontal and vertical locations of all groundwater monitoring wells;
- Compare the laboratory analytical results from the soil and groundwater investigations to the applicable Alberta Environment and Parks (AEP) *Alberta Tier 1 Soil and Groundwater Remediation Guidelines* (AEP 2016 Tier 1 Guidelines);
- Prepare updated cross-sections based on the new data obtained from the drilling; and
- Prepare a report documenting the data collected during the soil and groundwater investigations.

### Applicable Guidelines

The guidance document used to assess soil and groundwater analytical data from the Site was the AEP 2016 Tier 1 Guidelines. The AEP 2016 Tier 1 Guidelines specify a land use and a receptor pathway approach that formulates a specific standard for each different chemical parameter. Based on the current land use of the Site, the residential/parkland land use designation has been applied. For soil samples, the

applicable soil texture was the more stringent of either coarse- or fine-grained. For groundwater, the guideline for coarse-grained soil was used as it is the more restrictive guideline.

## **Intrusive Investigation**

### **Soil Investigation**

From 01 to 03 May 2018, Clifton personnel supervised the drilling of three boreholes (BH3001 to BH3003) and the installation of seven nested monitoring wells. The boreholes were advanced using a track-mounted, direct-push GeoProbe 8040 DT drill rig provided by All Service Drilling Inc. of Calgary, Alberta. All boreholes were initially completed to a depth of 6.1 m bgs. Borehole BH3003 was further advanced to a total depth of 9.1 m bgs and borehole BH3002 was deepened to 7.6 m bgs on 02 and 03 May 2018, respectively, using a hollow stem auger.

During completion of the boreholes, soil samples were collected by pushing a clear, acetate sampling core tube into the subsurface. The core tube was then extracted from the borehole and opened by the drilling crew. Clifton personnel described the recovered soil interval in the field for total recovery, composition, texture, colour, hardness, moisture content, and any other identifying features observed, including inclusions or alteration of the original material. Samples were measured, and identifying breaks in stratigraphy or soil type were noted by depth. The 1.5 m sample cores were split into a top and bottom interval with a composite sample collected from each interval. Soil was removed from the core tube with a stainless-steel putty knife, or by hand. All remaining soil cuttings were placed in a lined soil bag located on-site. The borehole logs are attached in Appendix B along with Clifton's standard Symbols and Terms document.

Soil samples from the boreholes were selected for analysis based on volatile soil vapour field screening results using a RKI Eagle 2 combustible gas monitor (Eagle 2) with a photo ionization detector (PID). In total, thirteen soil samples (two samples per borehole and one duplicate sample) were submitted for laboratory analysis of BTEX, PHC fractions F1-F4, PAHs and VOCs. Samples were transported in ice-filled coolers, under chain-of-custody, to Maxxam Analytics in Calgary, Alberta.

### **Groundwater Investigation**

Up to three groundwater monitoring wells were installed in each borehole, to varying depths. Three monitoring wells were installed at borehole BH3001 (BH3001A, B, and C), and two monitoring wells were installed at borehole BH3002 (BH3002A and BH3002B) and borehole BH3003 (BH3003A and BH3003B). The monitoring wells were constructed using 50 mm inner diameter (ID), Schedule 40 PVC. Solid PVC pipes of corresponding diameters were attached to screens. The solid pipe was capped with a J-Plug locking well cap. The annulus around the screen of the wells was backfilled with well-sorted, washed 10/20 filter sand placed from the bottom of the well to approximately 0.3 m above the screened interval. The well installation details are provided within the borehole logs in Appendix B.

Subsequently, the wells were sealed above the sand with a hydrated bentonite clay plug of at least 0.3 m in thickness. The annulus space around the pipe was filled with hydrated bentonite chips to just below the ground surface. Bentonite chips were hydrated with de-ionized water. Filter sand was placed above the hydrated bentonite chips. Flush-mounted, heavy-duty steel road boxes were installed to protect the monitoring wells. The road boxes were sealed into place above the sand with quick setting concrete.

On 03 May 2018, Clifton personnel re-visited the Site to conduct groundwater monitoring and sampling. The wells were monitored for total depth of well, LNAPL (if present), standpipe vapour concentration and water table depth; measurements were recorded in the field logs.

All monitoring wells were purged by removing three well volumes prior to sampling. Upon completion of the purging, a disposable bailer was used to obtain representative samples from each monitoring well for analysis of BTEX, PHC fractions F1 to F4, and VOCs. Samples were transported in ice-filled coolers, under chain-of-custody, to Maxxam Analytics in Calgary, Alberta.

Monitoring well locations were surveyed using an RTK GPS on 04 May 2018. The monitoring and sampling event is summarized in Table 1, Appendix C.

### **Quality Assurance / Quality Control**

Various methods of QA/QC were implemented throughout the program including the collection and analysis of trip blank samples and field duplicate samples, as well as laboratory QA/QC procedures. One soil duplicate and one groundwater duplicate were collected during this investigation. The results of the field duplicate QA/QC program are presented in Table 2 to Table 4 in Appendix C.

Trip blank sample results were all below the laboratory detection limits, which are considered acceptable. The soil and groundwater trip blank results are presented in Table 5 (Appendix C).

See the laboratory reports in Appendix D for the detection limits, testing protocols, and QA/QC procedures.

## **Results**

### **Soil Stratigraphy**

The stratigraphy of the new boreholes was used to update the cross-sections provided in the Clifton report *2016 Supplementary Drilling Report Hounsfied Heights – Briar Hill Community, Calgary, AB* (05 July 2016). All of the cross-sections, including updated and newly added sections, are included as Appendix D.

### **Soil Analytical Results**

Seven soil samples from three boreholes were selected for laboratory analysis of BTEX, PHC fractions F1-F4, PAHs, and VOCs. One duplicate sample was submitted for laboratory analysis of VOCs only. All results were either below the laboratory detection limits or met the AEP 2016 Tier 1 Guidelines. The results are presented in Tables 6 through 8 (Appendix C).

The collected soil cuttings were analyzed for Class II Waste Characterization and met the applicable guidelines for Class II Waste characterization. The results are presented in Table 9 (Appendix C). Laboratory Certificates of Analysis can be found in Appendix E.

### **Groundwater Well Monitoring**

A summary of groundwater field measurements, including depth to groundwater and total well depth, along with measured groundwater elevations, are provided in Table 1 (Appendix C). The groundwater elevation ranged from 1067.89 m (BH3001C) to 1072.12 m (BH3002A). The interpreted groundwater flow direction is

to the southwest. An updated potentiometric surface, incorporating these new wells, will be provided as part of the next semi-annual monitoring and sampling report.

### **Groundwater Investigation**

Eight groundwater samples including one duplicate were collected from the newly installed groundwater monitoring wells on-Site. All samples were submitted for laboratory analysis of BTEX, PHC fractions F1 and F2, PAHs, and VOCs. All groundwater samples were below the laboratory detection limits. The results are presented in Tables 10 through 12. Laboratory Certificates of Analysis can be found in Appendix E.

## **Discussion**

### **Soil Investigation**

Previous soil samples indicated that there were VOC exceedances in the southwestern corner of the Site, north of the 3000 series boreholes. The objective of this investigation was to delineate BTEX, PHC fractions F1 to F4, and VOCs in the soil. All of the soil samples collected as part of this investigation had concentrations of BTEX, PHC fractions F1 to F4, and VOCs that were below the laboratory detection limits. There were detectable concentrations of PAHs reported in four of the samples. Three of the samples were collected between 5.33 and 6.10 m bgs. It is unclear if these are background concentrations. None of the samples exceeded the applicable guidelines.

### **Groundwater Investigation**

Previous groundwater sampling events indicated that benzene and 1,2-DCA had not been delineated in Unit 3, the middle sandy silt, to the west. The objective of this investigation was to delineate these parameters in the groundwater. All of the groundwater samples collected during this investigation were below the laboratory detection limit for all CoPCs. Benzene and 1,2-DCA have, therefore, been delineated in the southwestern portion of the Site.

## **Conclusions**

Based on the soil and groundwater laboratory results, the CoPCs for the Site have been delineated to the southwest.

## **Recommendations**

Based on the results of this investigation, Clifton recommends that the monitoring wells be incorporated into the semi-annual monitoring and sampling program.

## **Closure**

This report was prepared by Clifton Associates Ltd. for the account of Sears Canada Inc. The material in it reflects Clifton Associates Ltd. best judgment available to it at the time of preparation. Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of such third parties. Clifton Associates Ltd. accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this report.

Our conclusions and recommendations are preliminary and based upon the information obtained from the referenced subsurface exploration. The Site monitoring and associated laboratory testing indicate subsurface, groundwater and chemical conditions only at the specific locations and times investigated, only

to the depth penetrated and only for the soil and chemical properties tested. The subsurface conditions may vary between the investigation points and with time. The subsurface interpretation provided is a professional opinion of conditions and not a certification of the site conditions. The nature and extent of subsurface variation may not become evident until construction or further investigation. If variations or other latent conditions do become evident, Clifton Associates Ltd. should be notified immediately so that we may re-evaluate our conclusions and recommendations.

This report has been prepared in accordance with generally accepted engineering practice common to the local area. No other warranty, expressed or implied is made.

No environmental site investigation or remediation can wholly eliminate uncertainty regarding environmental conditions in connection with a property. This investigation is intended to reduce, but not eliminate the uncertainty regarding environmental conditions. Conclusions regarding the condition of the site do not represent a warranty that all areas within the site and beneath structures are of the same quality as those sampled. Further, contamination could also exist in forms not indicated by the investigation. The work was based in part upon the environmental quality guidelines and regulations in effect when the work was begun. Future regulatory changes may require reassessment of the findings of this investigation.

VOCs in Soil by HS GC/MS (Std List) (1)	9	N/A	2018/05/08	AB SOP-00056	EPA 5021a/8260d m

**Remarks:**

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested.

Your Project #: CG2430.1 E28  
Your C.O.C. #: m070647

**CERTIFICATE OF ANALYSIS**

**MAXXAM JOB #: B833548**

**Received: 2018/05/03, 17:10**

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

\* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) No lab extraction date is given for F1BTEX & VOC samples that are field preserved with methanol. Extraction date is date sampled unless otherwise stated.

(2) Samples were extracted as per EPA 1311 unless otherwise noted in the report.

(3) All CCME results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil, Validation of Performance-Based Alternative Methods September 2003. Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

**Encryption Key**

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

Leanne Cameron, C.E.T., Senior Project Manager

Email: L.Cameron@maxxam.ca

Phone# (403) 291-3077

=====

This report has been generated and distributed using a secure automated process.

Maxxam has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

**Remarks:**

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

\* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) Silica gel clean up employed.

(2) B[a]P TPE is calculated using 1/2 of the RDL for non detect results as per Alberta Environment instructions. This protocol may not apply in other jurisdictions.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

### VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

---

Dennis Ngondu, B.Sc., P.Chem., QP, Supervisor, Organics

---

Jared Wiseman, B.Sc., P.Chem., QP, Senior Analyst, Organics

---

Veronica Falk, B.Sc., P.Chem., QP, Scientific Specialist, Organics

---

Maxxam has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Maxxam Job #: B835165  
Report Date: 2018/05/14  
Maxxam Sample: TK0386

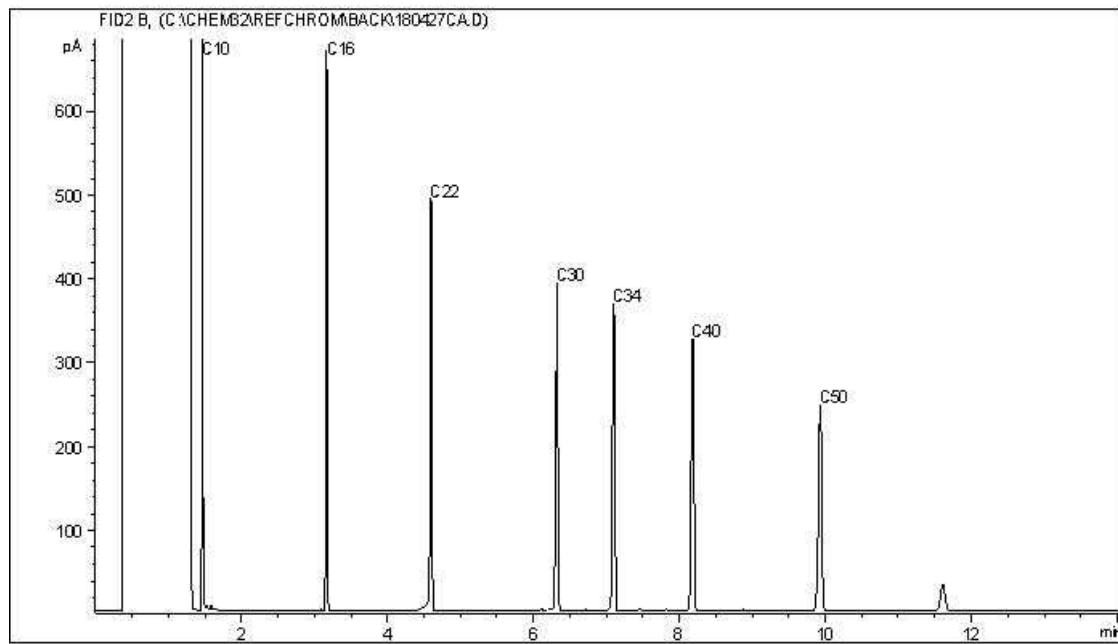

CLIFTON ASSOCIATES LTD.  
Client Project #: CG2430.1 E28  
Client ID: 3001 A

**CCME Hydrocarbons in Water (F2; C10-C16) Chromatogram**

Instrument: GC7

Carbon Range Distribution - Reference Chromatogram

**TYPICAL PRODUCT CARBON NUMBER RANGES**

Gasoline:	C4 - C12	Diesel:	C8 - C22
Varsol:	C8 - C12	Lubricating Oils:	C20 - C40
Kerosene:	C7 - C16	Crude Oils:	C3 - C60+

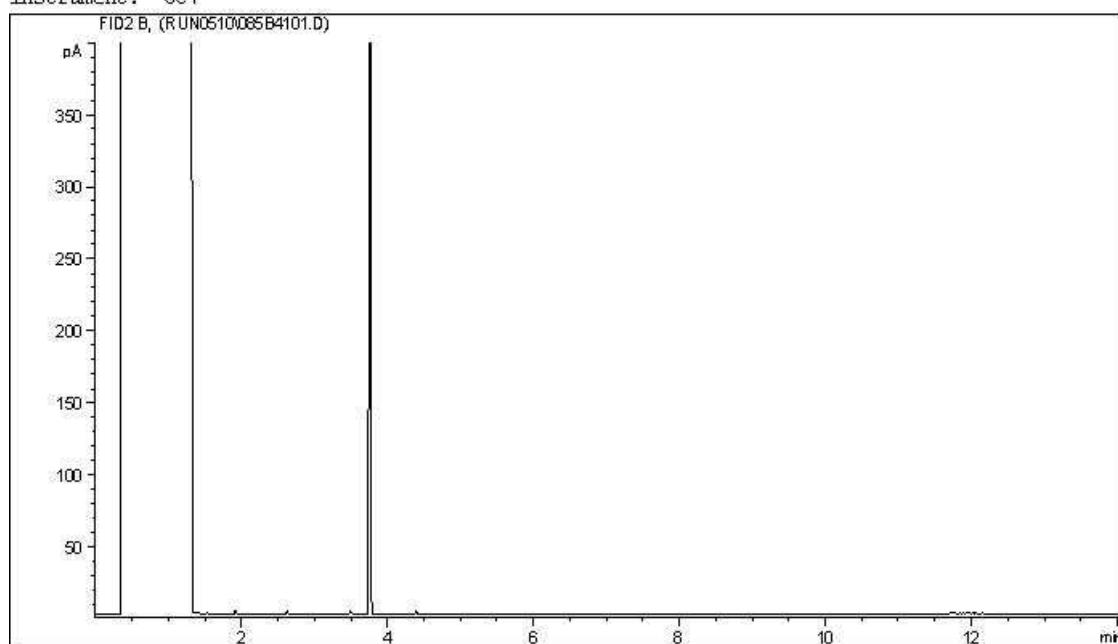

**Note:** This information is provided for reference purposes only. Should detailed chemist interpretation or fingerprinting be required, please contact the laboratory.
